class11:alphafold

Tin

Here we read the results from alpha fold and try to interpret all the models and quality score
metrics:

```
library(bio3d)

pth <- "hivdimer_23119/"

pdb.files <- list.files(path = pth, full.names = TRUE, pattern = ".pdb")
```

Align and supperpose all these models

```
file.exists(pdb.files)
```

```
[1] TRUE TRUE TRUE TRUE TRUE
```

```
pdbs <- pdbaln(pdb.files, fit = TRUE, exefile="msa")
```

```

Score Residue Conservation from aligment file

AlphaFold returns it's large alignment file used for analysis. Here we read this file and score conservation per position

```
aln_file <- list.files(path=pth,
                        pattern=".a3m$",
                        full.names = TRUE)
aln_file
```

```
[1] "hivdimer_23119//hivdimer_23119.a3m"
```

```
aln <- read.fasta(aln_file[1], to.upper = TRUE)
```
```
[1] " ** Duplicated sequence id's: 101 **"
[2] " ** Duplicated sequence id's: 101 **"
```

```
dim(aln$ali)
```

```
[1] 5378  132
```

```
sim <- conserv(aln)
```

```
plotb3(sim[1:99],
       ylab="Conservation Score")
```

Find the consensus sequence at a very high cut-off to find invarient residues

```
con <- consensus(aln, cutoff = 0.9)
con$seq
